Pylartin proteins which preserve progenitor cells - useful for haematopoietic therapies in cancer treatment or for treating haematologic diseases

```
The peptides AAW61497-W61502 can be used to form pylartin proteins which preserve progenitor cells (pc). The proteins can be used for protecting the integrity of the haematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can otherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for e.g. expanding PC populations ex vivo to increase chances of engraftation, improving conditions for transporting and storing PCs and for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases such as sickle cell anaemia and thalassemia.
                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence corresponds to the N-terminal region of a human Flk2 receptor protein-tyrosine-kinase ligand, isolated from phytohemagglutinin-stimulated human peripheral blood leukocyte
                                                                                                                                                                                                                                                                                                              .

The specification describes a composition of one or more members of FRIL family of progenior cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment, including radiotherapeutic cantender prior to treatment of the patient with FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. Cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangloblasts, and messenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
tissue culture conditioned medium. The ligand may be used in diagnosis of bone marrow disorders, and to stimulate the proliferation and/or differentiation of primitive hematopoietic stem cells. The ligand binds to a receptor protein-tyrosine-kinase expressed in primitive but not mature mammalian hematopoietic cells.

The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or aducing the hematopoietic progenitor cell-depleting activity of requesing the reatment, including radiotherapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient of reduces the hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the theorem of progenitor cells, hemangioblasts, and mesenchymmic stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing
chemotherapeutics, so that the patient can receive a higher dose of the
                          chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer

receptor interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a chemotherapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient. FRIL family members are useful for reduces the hematopoietic progenitor cell-depleting activity of the charapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemandioblasts, and mesenchymal cells. The composition is administered to reduce progenitor cell capitating effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive capitals also administered to patients having, or predisposed to developing a condition where the patients having, or predisposed to developing a condition where the patients having, or predisposed to a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia.
a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is derived from a FRIL (FIK2/FIt3 tyrosine kinase
                                                                                                                                                                              Gaps

The present sequence is a partial a FRIL (FIKZ/FIL3 tyrosine kinase receptor-interacting lectin) protein. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a chemotherapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment cell-depleting activity alleviates or having a hematopoietic progenitor cell-depleting activity of the having a hematopoietic progenitor cell-depleting activity of the chemotherapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics and preferably recover from cancer. It is also administered to patients having, or predisposed to developing
                                                                                                                                            ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoletic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

The proteins can be used for protecting the integrity of the hematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can otherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for the identification and localisation of PCs. The methods can be used for e.g. expanding PC populations ex vivo to increase chances of engraftation, improving conditions for transporting and storing PCs and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases such as sickle cell anaemia and thalassemia.
                                                                                                                                                                                                                                                                            Pylartin protein; progenitor cell; haematopoietic system; cancer; engraftation; haematologic disease; sickle cell anaemia; thalassemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                                                                                                                                                                                                                                                                   preservation factor. The protein is used to preserve unipotent, pluripotent or totipotent progenitor cells, especially haematopoletic cells, and also progenitors from nerve, muscle, skin, gut, bone, kidney, liver, pancreas or thymus. Specific applications are preservation of cultured cells intended for administration after (anticancer) myeloablative therapy (bone marrow or whole-body irradiation or chemotherapy) to reconstitute the haematopoletic system; enrichment of progenitor cells (e.g. during ex vivo purging of malignant cells); treatment of tissues containing haematopoletic progenitors for subsequent treatment to improve haematopoletic competence; improving transfer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exogenous DNA to progenitor cells (in gene therapy of various haematological disorders, e.g. sickle-cell anaemia); and protection against ablative therapy (to eliminate proliferating cells specifically), followed by re-establishment of differentiation and proliferation of preserved progenitors. The protein, when linked to magnetic beads, may also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                              Lectin derived progenitor cell preservation factor; progenitor cell; haematopoidetic cell; cultured cell preservation; anticancer therapy; myeloablative therapy; sickle-cell anaemia; ablative therapy protection; PLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding plant lectin that preserves progenitor cells - particularly haematopoietic progenitors, useful for bone marrow reconstitution after ablative therapy, and to increase DNA
                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a lectin derived progenitor cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The present sequence represents a FRIL (F)R2/F)13 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of chemotherapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient. FRIL family members are useful for reduces the hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the charapeutic treatment in the patient. FRIL family members are useful for sical sting population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cells depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a ligher dose of the patients having, or predisposed to developing can condition where the patients hematopoietic progenitor cells are condition where the patients members of the isolated mesenchymmal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the

having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a higher dose of the chemotherapeutic and preferably recover from cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is derived from a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemocherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment
                                                                                                                                                                                                                                                                                                                                                                                                                     Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 such as severe combined immunodeficiency or aplastic anemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                   severe combined immunodeficiency; aplastic anemia; tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                          The present sequence represents a Nkd (naked cuticle) polypeptide. In Drosophila, Nkd is a segment-polarity gene whose expression is induced by Wht signalling. The Nkd polypeptide acts to antagonize Wht signalling. Nkd may link ion fluxes to the regulation of Wht signal potency, duration or distribution. The Nkd polynucleotides can be used for identifying homologous or related proteins, to modulate the expression or function of Nkd polypeptides, and in studying associated physiological pathways. Nkd polynucleotides can also be used in gene therapy to treat disorders associated with Nkd defects. They may also be used for therapeutic purposes e.g. treatment of cancer.
                                                                                                          An isolated nucleic acid molecule useful for analyzing (genetic predisposition to) a disease state and for therapeutic purposes e.g. treatment of cancer comprises a sequence encoding a naked cuticle

Patent No. US20020132017A1
GENERAL INFORMATION:
APPLICANT: Moore, Jeffrey G.
TITLE OF INVENTION: Composition and Method for Preserving Progenitor Cells
FILE REFERENCE: 108236.136
CURRENT APPLICATION NUMBER: US/09/934,251A
CURRENT FILING DATE: 1999-08-05
PRIOR APPLICATION NUMBER: US 09/368,607
PRIOR APPLICATION NUMBER: US 08/762,537
PRIOR FILING DATE: 1996-08-05
NUMBER OF SEQ ID NOS: 4
SOFTWARE: FastSEQ for Windows Version 4.0
